

## RAM - RESTRICTED ACCESS MODULE

### SECURELY COMMUNICATE WITH:

- Distribution channel partners
- Internal company communications
- Work groups within for-profit, non-profit or government

Password protected area management

Access based on individual email address and assigned password

Dynamically built menu displays only allowable pages for each individual

The Restricted Access Module is a unique Web-Centrix functionality that allows an administrator to create sections and pages in a password protected area of a site.

Access to this protected area is based on administrator assigned user names and passwords.

The functionality allows an administrator to assign different levels of access rights to individual users. When an approved user logs in, the menu for the RAM area displays only the items that correspond to the rights level assigned to that particular individual.

Specific sub-pages, pages, or entire sections can be given access rights that correspond to levels granted to users.

Access rights can be based on a pyramid scheme in which each tier can see its assigned content plus that of any tier with lower rights, or as a silo scheme, in which each rights level can only see content for its own particular level.
